TITLE : MAGNETIC RECORDING AND

REPRODUCING DEVICE

ABSTRACT

: PURPOSE: To facilitate an easy video recording procedure such as the reservation of timer, etc. by recognizing a table of programs, for example, recorded on a recording card by means of ϵ cursor provided on a monitor TV screen to store the table to a memory and actuating a built-in timer and channel selection part according to the contents of storage.

CONSTITUTION: A recording card is put into a card slit 13 and a display button 14 is pushed to display the contents of the card on a TV screen. Then the information on TV programs are arrayed on each row. A cursor button 17 is pushed to set a cursor at the left end of a prescribed row. Then a recognition button 15 is pushed to display an asterisk mark at the right end of the same row. Thus the video recording is set by a timer 29. The information on this timer recording is stored in a memory 28 and then read out by the timer 29 at a prescribed time point. Then a control part 30 works perform the video recording of a program o: a prescribed channel at a prescribed time point. A confirmation button 21 is pushed after setting the video recording to display an asterisk mark at the right end of the row. Then only the contents with which the video recording is set by the timer are displayed successively and can be confirmed assuredly.

Specification.

- Title of the Invention
 A Magnetic Recording and Reproducing Apparatus
- 2. What we claim is:
- 1. A magnetic recording and reproducing apparatus characterized in that it is equipped with a display means by which to reproduce a recording medium on which there

is a procedure to be stored and to display the abovementioned procedure to be stored on a display screen, a cursor moving means by which to freely move a cursor on the above-mentioned display screen, a reading means by which to read only a procedure to be stored which is recognized by the above-mentioned cursor on the abovementioned display screen, a memory device by which to store the procedure to be stored which has been read by this reading means, a timer by which to read a procedure to be stored at a pre-determined date and time according to the procedure to be stored which has been stored in this memory device, a control section by which to operate the magnetic recording and reproducing apparatus itself according to the procedure to be stored which has been read by this timer, and a confirmation means by which to display on the above-mentioned display screen only the procedure to be stored which has been stored in the above-mentioned memory device, and that it is constituted in such a manner that after operating the magnetic recording and reproducing apparatus on a predetermined date and time by means of the above-mentioned control section according to the procedure to be stored which has been stored in the above-mentioned memory device, the fact that the operation has been completed is displayed on the above-mentioned display screen with respect to the procedure to be stored for which operations have been completed.

3. Detailed Explanation of the Invention

Utilization Fields in Industry

The present invention relates to a magnetic recording and reproducing apparatus.

Constitution of Conventional Examples and Problem Points
Thereof

With a conventional, for example, video tape recoder for home use (hereinafter referred to as VTR), in using the important function called program timer recording which a home VTR has, it has been required to go through complicated procedures which we will explain below. us explain the procedures by referring to Fig. 1 through Fig. 1 is an obliquely seen view of an Fig. 15. ordinary home VTR, and Fig. 2 is an enlarged front view of the timer display section and timer operating section of the same VTR: 1 is an actuating switching switch, 2 is a program button, 3 is a record start button, 4 is a record end button, 5 is a timer brightness switching button, 6 is a minute set button, 7 is a time set button, 8 is a button setting day of the week, 9 is a digital display section, and 10 is a second flashing display element. Let us explain the operating sequence by referring to an example. Let us assume that today is Monday, and we are to start recording of Channel 10 on 19:00 on Tuesday of the first week (that is, next day), and end the recording on 20:30.

(1) After turning on the power switch of this machine, open the cover of the timer operating section.

(Fig. 3)

If the right upper section of the timer operating section is pushed, the cover opens slightly.

Start the timer operation after the cover opens completely.

If there was power outage of about 60 minutes or longer, or the power cord thereof was pulled out from a plug socket for about 60 minutes or longer, the display as shown flashed.

- (2) Confirm that the timer set switch is "OFF". (Fig. 4)
- (3) Open the timer section and turn the actuating switch to "Program reservation". (Fig. 5)

The display of the current time disappears, and 8 programs of "1, 2, 3, 4, 5, 6, 7 and every week" starts to flash on the lower side of the digital display section 9.

The flashing indicates that no program has been set (empty program).

The programs which have already been reserved remain

lighted without flashing.

In addition, any program for which recording has been finished also flashes. (However, a program which has been set to everyday recording or every week recording remains lighted.)

At this time, among the channel display lamps, a lamp of a channel which was last received flashes.

- (4) Depress the program button 2. (Fig. 6)

 Flashing of "1, 2, 3, 4, 5, 6, 7 and every week"

 disappears, "1" is displayed, and "Start" begins to

 flash at the left side of the digital display section 9.

 If the program button 2 is continuously depressed, "1,

 2, 3, 4, 5, 6, 7 and every week. 1, 2, ... 10

 weeks" are displayed in sequence.
- (5) Depress the record start button 3. (Fig. 7)
 Flashing of "Start" stops, and " 0" which indicates
 today's day, current time, and programs of the 1st week
 flashes.
- (6) Depress the day set button 8 and set it to "Tuesday". (Fig. 8)

If this button is continuously depressed, the day display progresses, and "00" indicating the 2nd week is displayed.

If you passes the desired setting, depress the return button of the day set button 6 and return to the desired setting.

- (7) Depress the time set button 7, and set it to "19". (Fig. 9)
- (8) Depress the minute set button 6, and set it to "00". (Fig. 10)

If the minute set button 6 is not depressed, "End" does not flash, but it is possible to move to Operation (9) to set record end time.

- (9) Depress the record end button 3 (sic), setting the record end time (20: 30). (Fig. 11)
- "Start" display disappears and flashing of "End" stops.
- (10) Depress the time set button 7 to set it to "20". (Fig. 12)

Even if the day set button 8 is depressed, day does not change.

Depress the minute set button 6 and set it to "30". (Fig. 13)

In a case of program recording over 2 days, the display of day of the week automatically advances.

If the setting of time and minute of the record end time becomes before the record start time, the display of day of the week automatically advances to the next day.

A channel of a program which one wants to record (10 channel) is selected by the channel selection button of this machine. (Fig. 14)

The channel display button of the channel depressed begins to flash.

(Cautien)

The channel display lamp (of the channel) currently being received remains flashing.

If one forgets selection of a desired channel, the channel currently being received is programmed.

In a case where the channel currently being received is to be reserved, even if the channel selection button is depressed, the channel display lamp does not flash, but it is possible to set a program.

The actuating switching switch 1 is switched to "Normal Operation", and the timer set switch is turned "ON".

(Fig. 15)

If a video cassette has been inserted in a cassette holder, the timer set lamp flashes.

If the "claw" of a video cassette is broken, or a video cassette has not been inserted, the timer set lamp flashes.

In this manner, one program has been set (the so-called timer reservation). After this, there is separately an operation by which to confirm whether or not the reservation thus made has been made as desired by an operator, that is, a confirmation operation, but this operation is omitted here.

In this manner, setting of a program timer in a conventional home VTR requires proper judgment and

operations, and if those operations are not carried out accurately according to the sequence, reservation as desired can not be made, and therefore, we can not state that all people of ordinary homes who are supposed to mainly use it can use it satisfactorily.

Purpose of the Invention

The present invention is to eliminate the above-mentioned conventional defects, and the purpose of the present invention is to provide a magnetic recording and reproducing apparatus which allows one to set recording procedures as represented by timer reservation easily and simply.

Constitution of the Invention

In order to achieve the above-mentioned purpose, the magnetic recording and reproducing apparatus in accordance with the present invention is a magnetic recording and reproducing apparatus characterized in that it is equipped with a display means by which to reproduce a recording medium on which there is a procedure to be stored and to display the above-mentioned procedure to be stored on a display screen, a cursor moving means by which to freely move a cursor on the above-mentioned display screen, a reading means by which to read only a procedure to be stored which is recognized by the above-

mentioned cursor on the above-mentioned display screen, a memory device by which to store the procedure to be stored which has been read by this reading means, timer by which to read a procedure to be stored at a predetermined date and time according to the procedure to be stored which has been stored in this memory device, a control section by which to operate the magnetic recording and reproducing apparatus itself according to the procedure to be stored which has been read by this timer, and a confirmation means by which to display on the above-mentioned display screen only the procedure to be stored which has been stored in the above-mentioned memcry device, and that it is constituted in such a manner that after operating the magnetic recording and reproducing apparatus on a pre-determined date and time by means of the above-mentioned control section according to the procedure to be stored which has been stored in the above-mentioned memory device, the fact that the operation has been completed is displayed on the abovementioned display screen with respect to the procedure to be stored for which operations have been completed.

Explanation of an Example Embodying the Invention
In the following, we shall explain one example embodying
the present invention based on the drawings.

Fig. 16 is an obliquely seen view of the magnetic

recording and reproducing apparatus to which a receiver for monitoring purpose (hereinafter referred to as monitor "TV") is connected: 11 denotes a magnetic recording and reproducing apparatus unit, 12 is a monitor TV, 13 is a connecting cable by which to connect the magnetic recording and reproducing apparatus unit 11 and the monitor TV 12, 11a is a cassette mounting section which moves upward and downward ir order to insert or remove a cassette (not shown in the drawing) which contains a magnetic tape, 11b is a channel selection section, and llc is an operating section for timer recording : a state in which the above-mentioned section 11c is open, is shown in Fig. 17, and the operating section located inside the cover is shown in In Fig. 18, 13 denotes a card insertion opening, 14 is a display button by which to display the recorded content of the recorded card, 15 is a recognition button, 16 is a cancellation button, through 20 are cursor buttons by which to move the cursor on the screen of the monitor TV respectively in the directions of the arrows, and 21 is a confirmation button by which to display and confirm the content recognized by the recognition button 15. A recorded card 22 as shown in Fig. 19 is inserted into the abovementioned card insertion opening 13. This recorded card 22 has a recorded section 22a indicated with the oblique

lines, and this recorded section 22a whose basic material is, for example, made of an organic colloid, has holes of a diameter of about 5 microns formed by a laser beam as data bits, is of a size of 12 mm x 75 mm, and contains information of about 5 million recorded. The arrow A shows the direction of insertion of the recorded card 22.

Fig. 23 is a block diagram of the whole system: 23 is a central control device (hereinafter referred to as CPU), the card reader 24, the display means 25 by which to display on the display, the cursor moving means 26, the reading means 27, the memory device 28, the timer 29 and the control section 30 are controlled by this CPU 23, and the selection section 31 and a magnetic recording section (not shown in the drawing) are connected to this control section 30. The above-mentioned display means 25 displays on the display screen, that is, the monitor TV 12, a procedure to be stored which has been reproduced by the card reader 24, the above-mentioned cursor moving means 26 moves freely the cursor on the above-mentioned display screen, the above-mentioned reading means 27 reads only the procedure to be stored which has been recognized by the cursor on the abovementioned display screen, the above-mentioned memory device 28 stores the procedure to be stored which has been read by the above-mentioned reading means 27, the above-mentioned timer 29 reads the procedure to be stored on the pre-determined date and time according to the procedure to be stored which has been stored in the above-mentioned memory device 28, and the above-mentioned control section 30 actuates the magnetic recording and reproducing apparatus 11 on the above-mentioned pre-determined date and time.

Next, let us explain the operations thereof. In a case of making timer recording, the cover 11c of the operating section for timer recording of the magnetic recording and reproducing apparatus unit 11 is first opened, and the recorded card 22 is inserted into the card insertion opening 13. TV broadcasting programs for one month which can be received in this region have been recorded on this recorded card 22. If after inserting the recorded card 22, the display button 14 is depressed, Page 1 of the content of the recorded card 22 appears on the screen of the monitor TV 12 as shown in Fig. 21. Here Pl indicates that the first page is displayed, and information on the TV programs is listed and arranged from the next line. (The lines after the third line are omitted from the drawing.) On the line next to the line of Pl are listed date, time, program title and selection channel number in this sequence from In Fig. 21, the cursor is shown under P. the left. Next, if the cursor button 17 is depressed, the cursor moves down one line as it is depressed once. For example, let us consider a case in which timer recording is to be set on news on 1 ch from 7: 00 to 7: 20 on May 5th: the cursor is moved to the left side of the predetermined line as shown in Fig. 22. Next, if the recognition button 15 is depressed, * (asterisk sign) mark appears on the right side of this line as shown in Fig. 23, and the timer recording is set. If this is to be cancelled, the cursor is moved to the left side of the line to be cancelled, and the cancel button 16 is depressed. By this, the * mark disappears, and the timer record setting is cancelled. Once the timer recording has been set, this information is stored in the memory device 28 of the magnetic recording and reproducing apparatus unit 11, this memory is retrieved on the pre-determined date and time by the timer 29, and the control section 30 actuates recording of the program of the pre-determined broadcasting station for a pre-determined period of time on the pre-determined date In addition, if the confirmation button 21 and time. is depressed after the setting, a * mark appears on the right side of the line, only the content/contents (program/programs) whose timer recording has been set is/ are displayed in sequence, and by this, one can confirm without fail what has been set for timer recording. when the pre-determined time has elapsed and

recording of a certain content (program) among the contents (programs) set for timer recording has been completed, if the confirmation button 21 is depressed, a * (asterisk) mark/marks appears/appear on the left side/sides of the line/lines of only the content/contents (program/programs) for which the above-mentioned timer recording has been completed, though only a content/contents (program/programs) are displayed for which timer recording has been set, and thus it is possible to confirm that recording of the program/programs has been completed.

In the above-mentioned Example embodying the present invention, we have explained an example in which use is made of a recorded card 22 as a recorded medium, but it is a matter of course that we may adopt various systems as to a recorded medium and a method of capturing the information: for example, capturing data to be recorded on a printed matter by means of a bar code reader.

In addition, in the above-mentioned Example embodying the present invention, we have explained a case in which it is applied to the so-called timer recording of a broadcasting program, and the magnetic recording and reproducing apparatus in accordance with the present invention may be effectively utilized, for example, in a surveillance system including a magnetic recording and

reproducing apparatus which is used in a bank, a store, That is, in a VTR for surveillance which is etc. connected to a plurality of cameras, if we record such a content that, for example, a camera at the front gate may be used from 8: 00 to 10: 00, a camera in the neighborhood of a back gate from 12:00 to 13:00, etc. in one day, an operator can select and prepare easily and simply an optimum surveillance routine, depending on a administrative nature of a surveillance system, changes in season, surrounding environmental conditions, or a change in machines used in the surveillance system, In addition, this can be easily and simply etc. charged if so required, and therefore the practical merits are extremely great.

Effects of the Invention

As explained above, with the present invention, since it is structured in such a manner that for example, a program list recorded on a record card may be displayed on a monitor TV, it may be allowed to be recognized by a cursor on the screen, the information may be stored in a memory device in a magnetic recording and reproducing apparatus by this, and a timer and a station selection section contained therein may be actuated in conjunction with this stored content, a recording procedure such as represented by the so-called timer reservation may be

easily and simply set by very simple operations. In addition, since it is possible to display only the content/ contents reserved by the confirmation means, the confirmation operation can be carried out easily and accurately without fail. Furthermore, since only a program for which the timer recording has been completed is distinguished by a special mark on a display screen, it is possible to recognize at a glance that that recording has been completed.

4. Simple Explanation of the Drawings

Fig. 1 is an obliquely seen view of the appearance of a conventional home VTR, Fig. 2 is an enlarged front view of the timer display and timer operating section of the 3 through Fig. Fig. above-mentioned VTR, explanatory drawings of the timer recording operating sequence of the same VTR, Fig. 16 is an obliquely seen view of the magnetic recording and reproducing apparatus in one example embodying the present invention, Fig. 17 is an enlarged obliquely seen view of the timer recording operating section of the above-mentioned magnetic recording and reproducing apparatus, Fig. 18 is an enlarged front view of the above-mentioned timer recording operating section, Fig. 19 is an obliquely seen view of a recorded card, Fig. 20 is a block diagram of the magnetic recording and reproducing apparatus in one example embodying the present invention, and Fig. 21 through Fig. 23 are explanatory drawings of the display at the time of setting of the above-mentioned magnetic recording and reproducing apparatus.

11 is a magnetic recording and reproducing apparatus unit, 12 is a monitor TV, 21 is a confirmation button, 22 is a recorded card, 23 is a central control unit, 24 is a card reader, 25 is a display means, 26 is a cursor moving means, 27 is a reading means, 28 is a memory device, 29 is a timer and 30 is a control section
